

Technical Case Study

Name: [INSERT] | Date: [INSERT]

Stage 2 | Investment Memo

Assignment: investment memorandum

Design and build a system that produces an institutional-quality investment memorandum on one of ABVX, KYMR, PRAX, IMVT or COGT, drawing solely on public sources, with no human intervention between initiation and completed output. **Run it for the chosen company of your choice and submit the memorandum it produces.** The submitted code will also be executed.

SUBSTANCE

Analytical requirements

An investment in a drug developer resolves to a few questions: **does the asset work (MoA); will it be approved (PoS); how will it get approved (regulatory); what is the commercial opportunity (peak sales).** Each requires an estimate, the supporting evidence, and a confidence level. The memorandum must then establish what the market prices and where the candidate's view departs from it. A document that does not depart from consensus is a description, not a thesis.

Note on PoS: The probability attached to an asset must be built from the scientific evidence the system retrieves instead of generalized phase transition rates.

Figures: extraction, insertion and annotation

The memorandum must show the figures its argument rests on, not describe them. The system is to **take images directly from the company's corporate and data presentations** and the underlying disclosure, **insert them into the memorandum** at the point the claim is made, and **mark on the image itself** – arrow, box or callout – the feature the argument depends on. This is the system's work, not the candidate's afterwards.

METHOD

Design latitude and considerations

Architecture is unprescribed: component count, sequencing, and the allocation of work between models are for the candidate to determine and defend. Source selection is likewise open; locating the necessary public data is part of the exercise.

Consideration	Why it matters
Valuation of pre-revenue assets	Most of a drug developer's value sits in assets earning nothing that are more likely to fail than succeed. Earnings multiples do not describe this.
Arithmetic reliability	Models are unreliable across extended arithmetic chains, and the system will perform a great deal of arithmetic.
Absence of a data source	Regulatory dates, consensus estimates and prescription data have no programmatic source. Reporting an absence of data where one means an absence of enquiry is misleading.
Conflicting disclosure	Figures appear in tables, footnotes and images, and frequently disagree. Adjudicating between them is analysis, not engineering.
Verification that is genuine	Models tend to affirm what they are shown. Where one component reviews another's, explain what makes the review substantive.
Conditions for refusal	The system should be able to decline to produce a memorandum. Specify when it would.

OUTPUT

Deliverables

- 1 The system.** A repository that can be executed as submitted (not a document describing one.)
- 2 The reference memorandum.** One run on the chosen company, performed by the candidate, with intermediate output so the reasoning path is inspectable. Figures are to appear as the system inserted and annotated them. Treated as authoritative.
- 3 Documentation.** What was built; what was omitted and why; where it is unreliable; what a further month would fix.
- 4 An evaluation framework.** Not an assertion that the system works, but how that would be demonstrated.

ASSESSMENT AND ADMINISTRATION

Basis of assessment and administration

Judgement is weighted above coverage: a few components that function beat many that do not. A candid account of where a system fails carries more weight than one identifying none.

Tooling. Unrestricted as to language, framework, and model. State what was used and the cost of one run. List every external service the system depends on, and what you built in-house.

Execution environment. The submitted system will be executed by us from a fresh clone. It may call Anthropic or OpenAI models, with credentials supplied by us at run time, and must otherwise run without any account we would need to create.

Data. Public sources only. No paid subscriptions, and no collection method you would be uncomfortable describing.

Timeline. Five days from receipt of this document.

Submission. Share the repository and the memorandum for your chosen biopharma company to marcel@perceptivelife.com.
